

AI Innovation Engineer — Fresher / Intern Assignment

Data Solutions & AI Innovation Team · OnPoint

May 2026

We'd love to get to know you a bit better. You should not spend more than **6 hours** on this — we're not looking for perfect answers, just your honest perspective.

Part 1 — Job-fit Assessment

Any file format works fine (DOCX, PDF, XLSX, or whatever you're comfortable with).

Questions

1. **Why OnPoint?**
2. **Why you?**
3. **What is your most favourite project so far?** Tell us something about it.
4. **What is your plan for the next 6 months here? And after that?**
5. **When can you start?** Are there any points regarding your working time, study plan, or onboarding process that are worth noting?

Part 2 — Technical Assessment

Think of this as a mini-hackathon — we care much more about how you think through a problem than about production-ready code. Stopping at a **proof-of-concept (POC)** is completely fine; please don't over-engineer. Pick the **one problem** that excites you most, and walk us through your solution design — covering performance, limitations, costs, scalability, and how it actually helps the end-user.

A few things we'd particularly love to hear about:

- **Your agentic coding journey.** Did you bring AI into your implementation process? If so, how? Walk us through the techniques, libraries, and tools you used — prompt chaining, tool use, multi-agent orchestration, RAG pipelines, whatever applies. We're genuinely curious about how you think about AI-assisted development, not just the output.
- **Why your approach is better** than the obvious baseline — what trade-offs did you consciously make, and what would you do differently with more time?

Your submission can be in any format (.py, Colab notebook, Vercel deployment, short demo video). Choose what best shows your work. Include a short README or walkthrough that a non-technical stakeholder could follow — what the tool does, how to run it, and what its limitations are.

Problem 1 — The AI Interpreter

Background

OnPoint is growing rapidly and has welcomed many expats, alongside the acquisition of CREA from Thailand. For large internal events such as town halls, communication is conducted in Vietnamese — creating a real barrier for expat colleagues and the Thailand team. Hiring a professional cabin interpreter costs up to **\$1,000 per two-hour session**.

Problem Statement

Build a tool that provides **near-real-time interpretation between English and Vietnamese**.

Specification	
Input	Audio stream
Output	Text in original language + text in target language

Evaluation Criteria

Criterion	Target
Transcription word error rate (WER) on meeting audio	< 10%
Key entity preservation — numbers, dates, names, amounts	> 95%
Latency behind speaker	< 3 seconds
Cost per 2-hour session (vs. \$1,000 baseline)	< \$50

You are welcome to propose and justify additional criteria that better reflect your design choices.

Problem 2 — The Digital Contract Hub

Background

OnPoint manages a growing volume of hard-copy contracts across Legal, Finance, and operational teams. Finding a specific clause, tracking renewal dates, or comparing terms across vendors currently means manually digging through physical folders — slow, error-prone, and unscalable.

Problem Statement

Digitise hard-copy contracts and build a **knowledge hub** that allows Legal, Finance, and other teams to store, index, and search for contract information efficiently.

Specification	
Input	Scanned or photographed contract documents (PDF, image)
Output	Structured records — searchable by party, date, clause type, or free-text

Evaluation Criteria

Criterion	Target
OCR / parsing accuracy on key fields (parties, dates, amounts)	> 99%
Retrieval precision@3 on a known-answer query set	> 90%
Source citation — every answer cites exact clause and page	required
Clause extraction recall (type, renewal dates, governing law)	> 85%

You are welcome to propose and justify additional criteria that reflect your design choices.

Open Invitation

Have a different idea that you think would genuinely move the needle for OnPoint? Feel free to propose it — briefly describe the problem, your approach, and why it matters. We'd love to hear it.
